1.4 ANALYSIS OF ALGORITHMS

- introduction
- observations
- mathematical models
- order-of-growth classifications
- theory of algorithms
- memory

Basics

Bit. 0 or 1.

NIST

most computer scientists

Byte. 8 bits.

Megabyte (MB). 1 million or 2²⁰ bytes.

Gigabyte (GB). 1 billion or 2³⁰ bytes.

64-bit machine. We assume a 64-bit machine with 8-byte pointers.

some JVMs "compress" ordinary object pointers to 4 bytes to avoid this cost

Typical memory usage for primitive types and arrays

type	bytes
boolean	1
byte	1
char	2
int	4
float	4
long	8
double	8

primitive types

type	bytes
char[]	2N + 24
int[]	4N + 24
double[]	8N + 24

one-dimensional arrays

type	bytes
char[][]	~ 2 <i>M N</i>
int[][]	~ 4 <i>M N</i>
double[][]	~ 8 <i>M N</i>

two-dimensional arrays

Typical memory usage for objects in Java

Object overhead. 16 bytes.

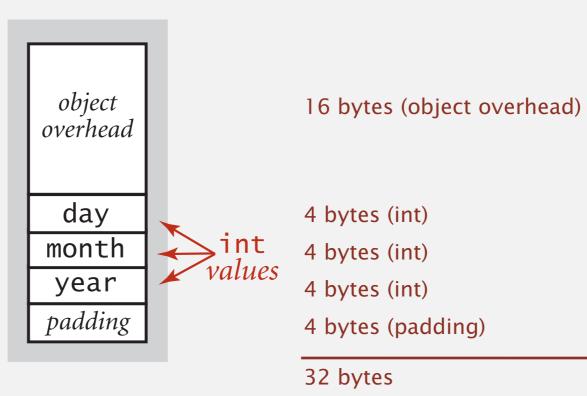

Reference. 8 bytes.

Padding. Each object uses a multiple of 8 bytes.

Ex 1. A Date object uses 32 bytes of memory.

```
public class Date
{
    private int day;
    private int month;
    private int year;
}

day
month
year
```

Typical memory usage summary

Total memory usage for a data type value:

- Primitive type: 4 bytes for int, 8 bytes for double, ...
- Object reference: 8 bytes.
- Array: 24 bytes + memory for each array entry.
- Object: 16 bytes + memory for each instance variable.
- Padding: round up to multiple of 8 bytes.

+ 8 extra bytes per inner class object (for reference to enclosing class)

Note. Depending on application, we may want to count memory for any referenced objects (recursively).
